

AIRO ONE - SEO, AIO & GEO Implementation Documentation

1. Overview

This document outlines the current state and future implementation strategies for Search Engine Optimization (SEO), Artificial Intelligence Optimization (AIO), and Generative Engine Optimization (GEO) across the AIRO ONE dual-domain platform (AIRO Essentials & AIRO Health Hub).

2. Where Can They Be Implemented?

Front-End (Next.js Application)

The vast majority of SEO, AIO, and GEO must be implemented on the **Front-End**.

- **Metadata API:** Setting dynamic `<title>` , `<meta name="description">` , and OpenGraph tags in `layout.tsx` and individual `page.tsx` files.
- **Semantic HTML:** Using proper `<article>` , `<section>` , `<h1>` , and `<h2>` tags so AI web crawlers understand the page structure.
- **Structured Data (JSON-LD):** Injecting Schema.org JSON scripts into the DOM. This is the **most critical** factor for AIO and GEO, as it feeds structured entities (like `MedicalClinic` , `Product` , `Pharmacy`) directly to AI models like ChatGPT, Gemini, and Google SGE.

Back-End (Firebase / Server)

- **Dynamic Sitemaps:** The server must dynamically generate `sitemap.xml` by pulling active products or clinics from the database.
- **Content Delivery:** Fast server response times (TTFB) directly impact SEO rankings.

3. Current Implementation Status

✅ SEO (Search Engine Optimization) - IMPLEMENTED

Standard SEO is already well-implemented across the platform.

- **Location:** `src/app/layout.tsx`
- **Features Active:**
 - Dynamic dual-domain title and description generation (switches automatically between AIRO Essentials and AIRO Health Hub).
 - OpenGraph (OG) and Twitter card metadata for social media sharing.
 - Canonical URLs to prevent duplicate content penalties.
- **Crawling Files:**
 - `src/app/sitemap.ts` is implemented and dynamically categorizes routes based on the domain.
 - `src/app/robots.ts` is implemented and blocks AI/Search bots from sensitive routes like `/admin/` and `/ecommerce/checkout` .

❌ AIO (AI Optimization) & GEO (Generative Engine Optimization) - NOT FULLY IMPLEMENTED

Currently, the platform relies only on basic text for AI context.

- **Missing Component:** The platform does **not** currently have Structured Data / JSON-LD schemas injected into the pages.
 - **Why it matters:** Generative AI engines (like Perplexity, Google AI Overviews, and ChatGPT) heavily prioritize websites that explicitly define their entities via JSON-LD. For a health hub, lacking `MedicalClinic` and `Physician` schema means AI engines will struggle to confidently recommend AIRO Health Hub in generative answers.
-

4. Next Steps for AIO & GEO Implementation

To fully optimize for AI engines, the following should be added to the front-end codebase:

1. **LocalBusiness & MedicalClinic Schema:** Add JSON-LD to the Health Hub homepage detailing the services, location, and opening hours.
2. **Product Schema:** Add JSON-LD to the E-Commerce pages (Bakery, Grocery) to feed pricing and availability to AI shopping assistants.
3. **FAQ Schema:** Add structured FAQs so AI models can directly quote AIRO's answers in AI Overviews.
